

Notes for White Stone

First screen feedback:

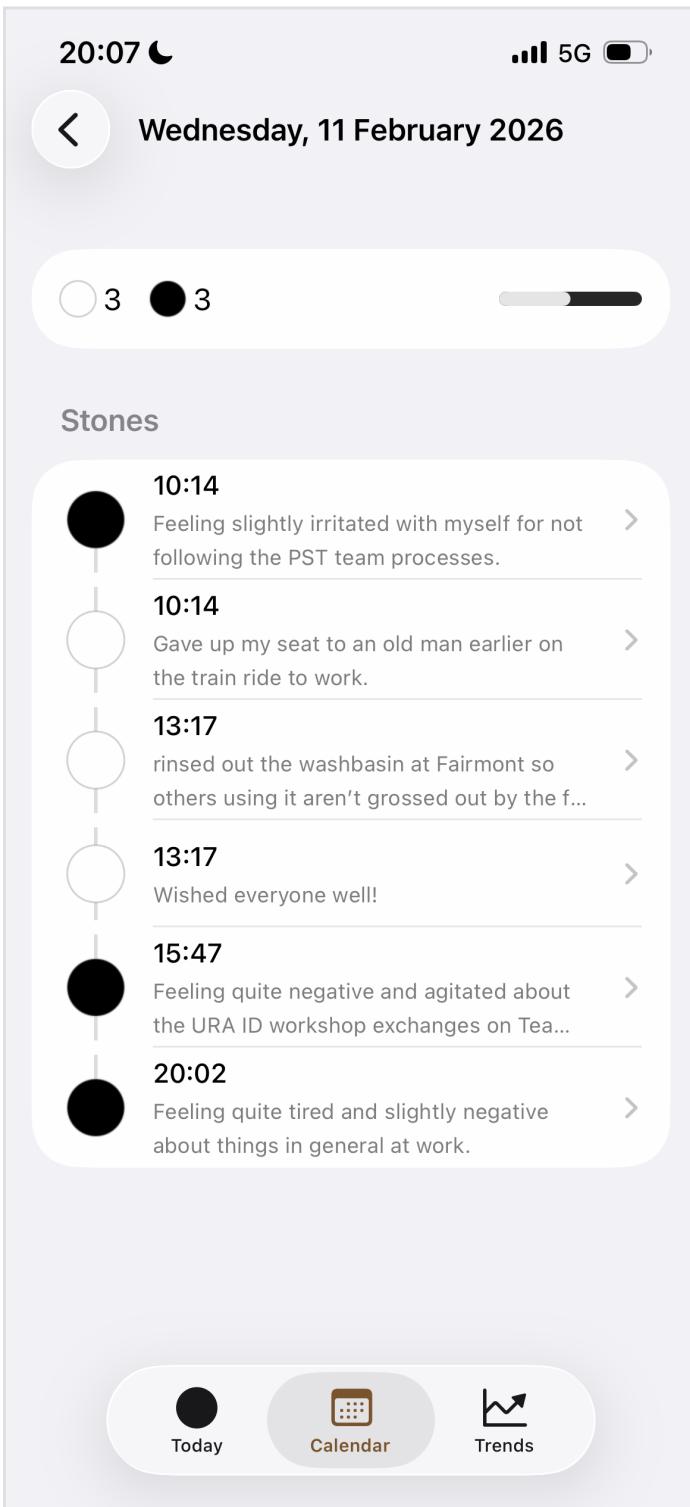

- to be able to scroll down to reveal the daily stones so far (the stones view, which currently is only in Calendar).
- The haptic when we tap on the stones should be longer and last about half a second .
- instead of Two stones On the screen, can we have a single stone in the center of the screen that if we swipe left or right it Flips on the y-axis (e.g. from white to black, and vice versa). and if we press in the middle

that triggers the model for that colored stone.

Modal feedback

- When the save button is clicked, there should also be a haptic feedback

The Calendar's Stones view has weird spaces between the lines that connect between the different stones. Can these gaps be removed ?

Can the white stone count be above? and the black stone count be below, instead of currently the black stone count stacked above the white stone count in the chart?

Can the shade of the day be directly proportional to the white stone count versus black stone count ratio on the gray scale?
